

Barsha Sitoula

Senior Java Backend Developer

Barshasitoula888@gmail.com | | [LinkedIn](#)

Professional Summary

Senior Java Developer with extensive experience building scalable backend systems and distributed applications in financial services, healthcare, and enterprise cloud environments. Strong background in designing microservices using Java, Spring Boot, and RESTful APIs while implementing event-driven architectures with Apache Kafka to support real-time data processing.

Experienced in developing cloud-native platforms on AWS and Google Cloud, deploying containerized services using Docker and Kubernetes, and automating infrastructure through Terraform and CI/CD pipelines. Skilled in designing high-availability backend services, integrating enterprise messaging systems, and optimizing relational and NoSQL databases to support data-intensive applications.

Hands-on experience delivering backend platforms that support secure financial transactions, healthcare workflows, and large-scale data pipelines, while collaborating with frontend teams building Angular and React interfaces. Passionate about improving engineering productivity through automated testing, observability platforms, and modern developer tools including GitHub Copilot and AI-assisted development environments.

Technical Skills

Programming Languages: Java, Python, JavaScript, Shell Scripting

Backend Frameworks: Spring Boot, Spring MVC, Spring Security, Hibernate, Apache Camel, Apache Airflow

API Development & Integration: REST APIs, GraphQL, SOAP Services, OpenAPI/Swagger, Feign Client

Frontend Technologies: Angular, React, HTML, CSS, JavaScript

Messaging & Streaming: Apache Kafka, RabbitMQ, JMS, AWS SNS, AWS SQS

Cloud Platforms: AWS (EKS, Lambda, API Gateway, S3, Redshift, EventBridge), Google Cloud Platform (GKE, BigQuery, Cloud Functions, Cloud Run, Pub/Sub)

DevOps & Infrastructure: Docker, Kubernetes, OpenShift, Terraform, Ansible, Jenkins, GitLab CI/CD, ArgoCD

Databases: PostgreSQL, Oracle, MySQL, DynamoDB, Redis, BigQuery, Snowflake

Monitoring & Observability: Prometheus, Grafana, Splunk, Dynatrace, ELK Stack, AWS CloudWatch

Security: OAuth2, JWT, Single Sign-On (SSO), LDAP, Active Directory, IAM

Testing: JUnit, Mockito, Selenium, Cypress

Developer Tools: Git, IntelliJ IDEA, Maven, JIRA, Confluence, GitHub Copilot

Professional Experience

Senior Full Stack Java Developer

LPL Financial — Fort Mill, SC

March 2022 – Present

- Develop backend services supporting brokerage platforms responsible for payment processing, digital transfers, and investment account management.
- Design microservices using **Java 17 and Spring Boot**, exposing REST APIs that support financial transactions including BillPay, ACH transfers, and account reconciliation services.
- Implement event-driven workflows using **Apache Kafka and AWS EventBridge**, enabling reliable communication between transaction processing systems and downstream analytics services.
- Deploy containerized backend services using **Docker and Kubernetes (EKS/OpenShift)**, enabling scalable application deployments across multiple cloud environments.
- Automate infrastructure provisioning using **Terraform and Ansible**, allowing repeatable environment creation for development, testing, and production systems.
- Develop ETL pipelines using **Apache Airflow, AWS Glue, and Informatica**, supporting ingestion and transformation of large financial datasets into Redshift and S3 data lakes.
- Build secure APIs using **OAuth2 and JWT authentication**, enforcing authorization policies for brokerage applications handling sensitive financial data.
- Develop asynchronous messaging workflows using **AWS Lambda, SQS, and SNS** to process background jobs and event notifications across distributed services.
- Implement distributed caching strategies using **Redis and AWS ElastiCache** to reduce database load and improve service responsiveness.
- Integrate application monitoring tools including **Prometheus, Grafana, Splunk, and Dynatrace**, enabling engineering teams to track service health and investigate production issues.
- Develop frontend integrations with **Angular applications**, defining API contracts and supporting real-time data synchronization through WebSockets.
- Maintain CI/CD pipelines using **GitLab, Jenkins, and ArgoCD**, automating build validation, container image creation, and Kubernetes deployments.
- Participate in code reviews and architectural discussions to improve microservice reliability, scalability, and maintainability.

- Collaborate with product managers, QA engineers, and platform teams to deliver secure and compliant financial services aligned with regulatory standards.

Senior Java Developer

Valley Bank — Wayne, NJ

September 2019 – February 2022

- Develop enterprise banking services responsible for loan processing, wire transfers, and internal financial reporting platforms.
- Build backend microservices using **Java and Spring Boot**, implementing REST APIs supporting internal banking systems and external integrations.
- Design event-driven processing pipelines using **Kafka and GCP Pub/Sub**, enabling asynchronous processing of payment events and transaction records.
- Deploy containerized applications using **Docker and Google Kubernetes Engine**, enabling scalable backend infrastructure for high-volume banking operations.
- Implement serverless components using **Cloud Functions and API Gateway**, supporting event-based workflows within the banking platform.
- Automate cloud infrastructure deployment using **Terraform**, enabling consistent environment provisioning across development and production systems.
- Develop ETL pipelines using **Apache Airflow**, supporting ingestion and transformation of financial data into **BigQuery** analytical datasets.
- Implement authentication and authorization using **LDAP, Active Directory, OAuth2, and JWT**, ensuring secure access across enterprise applications.
- Develop frontend interfaces using **React**, creating reusable components and state-managed UI modules for internal banking dashboards.
- Optimize SQL queries and database structures within **PostgreSQL and Oracle**, improving performance of financial reporting and reconciliation systems.
- Integrate automated testing frameworks including **JUnit, Selenium, and Jest** to support reliable application releases.
- Monitor application performance using **Prometheus and Google Cloud Monitoring**, enabling proactive incident detection and operational visibility.
- Participate in Agile engineering processes including sprint planning, backlog refinement, and continuous delivery initiatives.

Java Developer

Teladoc Health — Purchase, NY

September 2017 – August 2019

- Develop backend services supporting telehealth platforms used for patient communication, appointment scheduling, and healthcare data processing.
- Build REST and SOAP services using **Java and Spring Framework**, enabling integration between telemedicine applications and healthcare provider systems.
- Develop secure healthcare APIs that comply with **HIPAA data protection requirements**, ensuring privacy of patient medical records.
- Implement role-based authentication using **Spring Security**, restricting access to protected medical information.
- Integrate enterprise messaging systems using **JMS, AWS SNS, and SQS** to process appointment notifications and healthcare workflow events.
- Develop Angular components used in patient dashboards and provider management portals.
- Design relational database schemas in **MySQL** and optimize queries using Hibernate ORM.
- Develop batch processing jobs to reconcile patient data and synchronize medical records across healthcare systems.
- Deploy applications to **WebLogic servers**, supporting high-availability healthcare services.
- Implement application monitoring and logging using **ELK Stack and Prometheus** to support operational troubleshooting.
- Collaborate with cross-functional healthcare teams including product managers, QA engineers, and DevOps specialists.

Education

Master's in Business Analytics from Atlantis University
